These are the selectors for words and sentences.

When given a word or a sentence...

- `first` returns the first part of the input...
- `last` returns the last part...
- `butfirst` returns all but the first part of the input...
- And `butlast` returns all but the last part!

Select other parts of words and sentences, such as the second or third element, by combining selectors!

```lisp
(last (butlast '(roll on cal bears)))
```

One thing to note here is that the selectors don't actually change the input they're given. They make a copy of the input and do their work on the copy.
