

Functions as Data

The secret to Scheme's success

Most functions take in data as arguments and output data.

```
;; Compute sum of squares
> (define (sum-of-sq x y)
    (+ (* x x) (* y y)))
sum-of-sq

> (sum-of-sq 3 4)
25
```

But Scheme is great because it's easy to pass functions as arguments, like they're data!

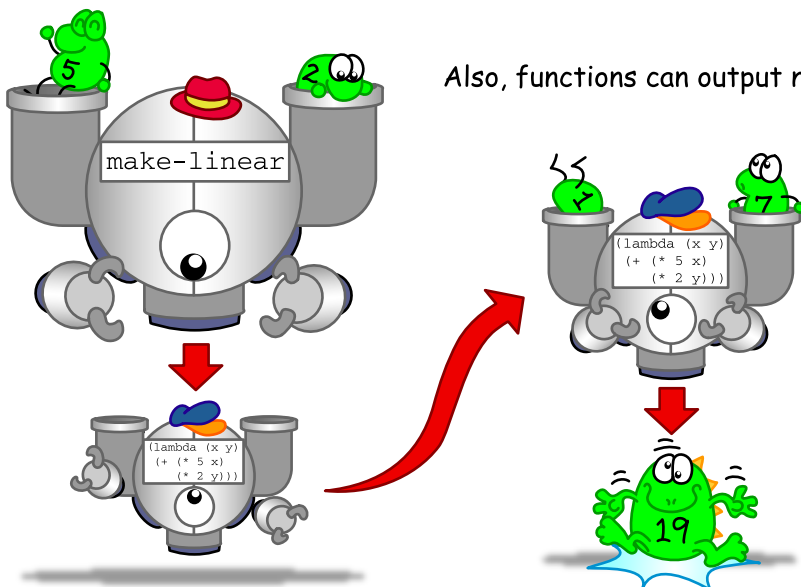

```
> (define (add2 n) (+ n 2))
add2

;; Invoke a function twice
> (define (call-twice func x)
    (func (func x)))
call-twice

> (call-twice add2 20)
24
```

Also, functions can output new functions!

```
;; Generate a linear equation function
> (define (make-linear a b)
    (lambda (x y) (+ (* a x) (* b y))))
make-linear

> ((make-linear 5 2) 1 7)
19
```
